

Day 5.

Understanding CSS Display

The **Display property** in CSS defines how the components (div, hyperlink, heading, etc) are going to be placed on the web page. As the name suggests, this property is used to define the display of the different parts of a web page.

Different Display Properties

There are many display properties that we have in CSS but for this lecture, we will cover the most widely used once

1. Block, Inline and Inline-Block
2. Flex
3. Grid

The best way to understand this is through practice but before that let's have an overview of all of them and what they mean

Block, Inline and Inline-Block

1. The block value is used to display an element as a block element
2. The inline value is used to display an element as an inline element
3. It is used to display an element as an inline-level block container.

Flex Display

It is used to display an element as a block-level Flex container

Grid Display

It is used to display an element as a block-level Grid container
